Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

```
x=int(input())
y=[int(i) for i in input().split()]
y.sort()
for j in y:
    print(j,end=" ")
```

Input Format

The first line contains an integer, n, the size of the <u>list</u> n. The second line contains n, space-separated integers n.

Constraints

- 2<=n<=600
- \cdot 1<=a[i]<=2x10⁶.

Output Format

You must print the following three lines of output:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted list.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

Sample Input 0

3

123

Sample Output 0

<u>List</u> is sorted in 0 swaps. First

Element: 1

Last Element: 3

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 19284	List is sorted in 4 swaps. First Element: 1 Last Element: 9

Bubble Sort

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted list.
- 3. Last Element: lastElement, the *last* element in the sorted list.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps. First Element: 1
Last Element: 6

```
n=int(input())
array=input().split()
count=0
for i in range(n):
  array[i]=int(array[i])
for i in range(n):
  swapped= False
  for j in range(0, n - i - 1):
     if array[j] > array[j+1]:
       array[j],array[j+1]=array[j+1],array[j]
       count+=1
       swapped= True
  if not swapped:
     break
l=len(array)-1
print("List is sorted in",count,"swaps.")
print("First Element:",array[0])
print("Last Element:",array[1])
```

Input Format

The first line contains a single integer n , the length of A . The second line contains n space-separated integers, $\!A[i]\!$.

Output Format

Print peak numbers separated by space.

Sample Input

5

891026

Sample Output

106

Input	Result
4 12 3 6 8	12 8

Peak Element

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

```
A[i-1] \le A[i] >= a[i+1] for middle elements. [0 < i < n-1] A[i-1] \le A[i] for last element [i=n-1] A[i] >= A[i+1] for first element [i=0]
```

```
n = int(input(""))
arr = list(map(int, input("").split()))

peaks = []

if n > 1 and arr[0] >= arr[1]:
    peaks.append(arr[0])

for i in range(1, n - 1):
    if arr[i - 1] <= arr[i] >= arr[i + 1]:
        peaks.append(arr[i])

if n > 1 and arr[-1] >= arr[-2]:
    peaks.append(arr[-1])

print(" ".join(map(str, peaks)))
```

Input	Result
12358	False
3 5 9 45 42 42	True

Binary Search

Write a Python program for binary search.

```
n=input()
k=input()
if k in n:
    print(True)
else:
    print(False)
```

Input:

1 68 79 4 90 68 1 4 5

output:

12

42

5 1

68 2

79 1

90 1

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

Frequency of Elements

To find the frequency of numbers in a list and display in sorted order.

Constraints:

```
1<=n, arr[i]<=100
```

Solution:

```
num=input()
```

num=num.split()

numbers=[]

for i in num:

numbers.append(int(i))

frequency_dict = {}

for num in numbers:

 $frequency_dict[num] = frequency_dict.get(num, 0) + 1$

 $sorteds = \{k \hbox{:}\ v\ for\ k,\ v\ in\ sorted(frequency_dict.items())\}$

for num, freq in sorteds.items():

print(num,freq)
